04] Stock Maintainance System

Software Requirement Specification [SRS] for stock Maintainance System.

1. Introduction.

1.1 Purpose of this Document

To outline the requirement and specification for the development of a stock maintainance system it will provide a clear understanding of the project objectives scope & deliverables.

1.2 Scope of this Document

This Document defines the overall working and main objectives of the Stock maintainance system it includes stock tracking, product management, purchase and Sales records, inventory updates and reports

1.3 Overview

The Stock maintainance system is a software solution designed to streamline inventory operations, including product registration, stock monitoring, purchase management, Sales management, low stock alerts and reporting

2. General Description.

The stock maintainance system will cater to the needs of store managers, employees and administrators by providing features such as product Management, inventory tracking,

stock updates, suppliers management and financial reporting.

3. Functional Requirements.

3.1 Product Management
. Allow users to add, update and remove product records.
. Maintain Product details such as name, category, price and quantity.

3.2 Stock Management
. Track available stock in real-time.
. Update Stock automatically after purchases and sales.

3.3 Suppliers Management.
. Maintain Suppliers information and purchase records.
. Record incoming stock from Suppliers.

3.4 Alerts and reporting
. Generate alerts when stock reaches the minimum level
. Generate stock & sales reports for management

4. Interface Requirements.

4.1 User Interface
. Integrate intuitive and user feriendly interface for employee & managers.

- Display current stock levels and product information clearly.

4.2 Integration Interface.
- Integrate with barcode scanners & billing system.
- Support integration with accounting systems where required.

5. Performance Requirements.

5.1 Response Time.
- The System should respond to users actions within 2 seconds.

5.2 Scalability.
- Handles a minimum of 1000 concurrent users during peak hours

5.3 Data Integrity.
- Ensure accurate and consistent inventory records

6. Design Constraints.

6.1 Hardware limitations
- The system should be compatible with standard computers, printers and barcode scanners.

6.2 Software Dependencies
- Utilize a relational database Managment system such as MySQL
- Ope Suitable programming languages and frameworks for application development.

7. Non-functional Attributes

7.1 Security
Implement authentication & authorization to protect inventory information.

7.2 Reliability
Ensure accurate stock updates & minimize system downtime.

7.3 Scalability
Support increasing numbers of Productions.

7.4 Portability
Supports multiple platforms & devices.

7.5 Usability
Provide a simple interface with clear navigation.

7.6 Reusability
Use Modular code design to support future enhancement.

7.7 Compatibility
Support common web browsers and inventory hardware.

7.8 Data Integrity
Ensure accurate and consistent storage and retrieval of stock information.

8. Preliminary Schedule & Budget

The Development of the stock Maintainance system is estimated to take 6 months with a budget of $200000 - this includes planning, development, testing and deployment.

planning - 20000
development = 80000
testing = 50000
deployment = 50000
